KEYPOINTS

Urban park.
Enhancement of outdoor facilities.
Wooden structure.
Long-span buildings.
Sports hall.
Extension.

ENVIRONMENTAL PERFORMANCE

Bioclimatic design.
Energy efficient building envelope.
Low-carbon building materials.
Water management.
Improvement of biodiversity.

The project entails enhancing the image of and increasing the number of visitors to this historic 19th century sports centre in the heart of the greater Paris area, between the Bois de Boulogne and the La Défense district, through the development of new activities and the upgrading of existing facilities.

The aim is to transform the perception of this purely sports park into an "urban park" in which sports areas are integrated into it.

The development of the external spaces is organised around seven distinct areas: the activity halls; the main central avenue; the site entrance; the central green space, perpendicular to the main avenue, linking the two sides of the development; the two parking areas, one of which already exists; and the urban golf course.
